

# Spares catalog in different languages in a breath

Fabdec Limited is manufacturer of high-quality stainless steel products for agriculture and provides a multitude of spare parts.

### Parts lists via relations

Main products like milk coolers and pumps have a wide range of common spares, like e.g. extension shafts, gaskets. However, every spare part has to be maintained only ONCE in ANTEROS. For that purpose a relation from the relevant main products to the spares is created. As every main product applies for other parts lists data (e.g. part number in spares drawing) those data is deposited on the relation.

### Data in six languages

Product data are maintained by Fabdec in the languages German, English, French, Polish and Russian. That is the reason why the ability of ANTEROS for multi alphabets has been very important: without reloa-

ding fonts German and Russian catalog pages can be generated from the system. Furthermore prices for different distribution areas and currencies are deposited.

### Catalog and data on-demand

At any time print catalogs or catalog extracts can be generated out of the current product data of the PIM system. In order to start the print generation, Fabdec chooses the relevant language and type of pricing and on-demand receives the catalog pages without any typesetting system, that is to say 100% automated. Beyond that via import/export-framework Fabdec is able to generate product data for customer or trader requests on-demand in EXCEL, CSV oder XML format.

„With ANTEROS we are able to generate our spares catalogs quite efficiently and even in five languages. We are positioned considerably better in the respective markets. We can generate catalogs at any time with up-to-date data and perform customer requests concerning electronic product data very quickly with the aid of ANTEROS.“

Hr. Haddad,  
Director of Fabdec
